Abstract (en)

[origin: WO2019018589A1] A computer implemented method of translation of verification commands of an electronic design, comprises the steps of receiving the electronic design, receiving at least one analog test harness model having at least one indirect branch contribution statement and having at least one of at least one stimulus parameter stored in at least one specification database and at least one measurement parameter stored in at least one specification database and at least one specification parameter stored in at least one specification database, translating the at least one indirect branch contribution statement into a plurality of direct branch contribution operators based at least in part upon the at least one analog test harness model and at least one of at least one stimulus parameter stored in at least one specification database and at least one measurement parameter stored in at least one specification database and at least one specification parameter stored in at least one specification database and generating a netlist based at least in part upon the translation.
