Abstract (en)

Two-way rear connection sleeve for the extraction of gases from a toilet that has two connections in front: a main one (12) connectable to a toilet siphon and another secondary connection (11) for the elimination of gases, while behind it has a single common connection (13) that can join to a discharge (7), where the length of the sleeve is such that it allows the formation of a cohesive and efficient water column, in the secondary connection (11) for the gases, it is possible to provide a one-way check valve (18) or in its absence a plug and in the secondary connection (11) an external hose (9) is connectable. The object of the invention is also a toilet on which said two-way sleeve is assembled, which has a power group (8) connectable to the sleeve via an external hose (9) or the toilet has a second pipe (15).
