Abstract (en)
[origin: WO2019020827A1] The present invention relates to a key (1) for a motor vehicle, comprising: - a housing (10) comprising a receptacle (102); - a pivoting yoke (11) which is mounted between two flanges (100, 101) of said receptacle and comprises two primary grooves (111) and at least one secondary groove (112); - a control pusher (13) comprising a primary protrusion (130) that is designed: - to be inserted into one of the primary grooves (111) when said control pusher (13) is in a released position so as to prevent said yoke (11) from rotating; - to disengage from said primary groove (111) when said control pusher (13) is in the depressed position so as to allow said yoke (11) to rotate; - to be prevented from moving in translation by a part (1100, 112) of said yoke (11) so as to avoid the disassembly of said control pusher from said receptacle when said housing is open.
