Abstract (en)

[origin: EP3659448A1] This invention relates to a machine for making filters for smoking articles comprising at least two forming beams (2) placed side by side, each extending predominantly along a longitudinal axis and having an internal channel (7) adapted to form a stream of tow. Each forming beam (2) is associated with a respective porous conveyor element (9) configured to slide inside the respective channel (7) and to carry the tow along a feed path (8) parallel to the longitudinal axis. The conveyor element (9) is adapted to comply with the shape of the transverse cross section of the internal channel (7) and to be at least partly wrapped around the tow. Each forming beam, (2) is also provided with a succession of treatment stations (10) located along the feed path (8) of the respective forming beam (2) and comprising at least one nozzle (11) configured to blow a flow of steam into the respective internal channel (7).
