Abstract (en)  
[origin: WO2019024975A1] The aim of the invention is a device for disinfecting the skin comprising: means of withdrawing a first and a second fluid from a first (1) and a second (2) reservoir, means of conveying the first and second fluids to a spraying device (12), means of pressurising said first and said second fluids upstream from the means of spraying, by a gas under pressure. The spraying device sprays successively in time said first followed by said second fluid, wherein said first fluid is ozonated water and said second fluid is a hydroalcoholic (HAS) solution. The device comprises means of measurement and of control of the volume of fluid withdrawn from the first and second reservoirs (1,2). The injection device (12) allows synergic spraying of the first and second fluids.
