Abstract (en)
[origin: WO2019025081A1] The invention relates to a mount 10 for a segment 25 in a strand guide 20 underneath the mold of a continuous casting system 100. The segment is typically connected via the mount to the fixed side 28 of the strand guide 20. In order to ensure that, in particular during casting operation – an optimal, i.e. in particular smooth or clearance-free transition from the mold to the first segment and in the transition between adjacent segments of the strand guide is always ensured for the casting strand, the invention provides for the mount to be formed as a floating bearing, in such a way that the segment supported therein is fixed in the Z direction but is freely movable in the X direction.
