Abstract (en)

[origin: WO2019025509A1] The invention relates to a device for picking up and transporting loads, which can be mounted on a movable or stationary apparatus. The device according to the invention is characterized in that the first guide profiled element has a hollow profiled element and that in the first guide profiled element a drive element is at least partly integrated in the interior of the guide profiled element, wherein a driver plate is operatively connected to the drive element and the guide of the driver plate is also at least partly integrated and mounted in the guide profiled element, the drive element and the guide of the driver plate lying on an axis, the first guide profiled element having a longitudinal slit, through which the retainer of the driver plate protrudes, a load-handling element being operatively connectable to a driver plate.
