Abstract (en)

[origin: WO2019034278A1] An electrical appliance (10) has at least one unit (12) for performing program cycles of the electrical appliance (10), a voice input apparatus (20) for capturing a voice command (22) from a user (24), a voice recognition interface (26) by means of which the voice input apparatus (20) is connectable or connected to a voice recognition device (28) for evaluating the captured voice command (22), an operating component (16) operable by a user (24) and an action detection apparatus (18) for detecting operation of the operating component (16) by a user (24). A controller (14) that is connectable or connected to the voice recognition device (28) and is connected to the action detection apparatus (18) is configured such that it actuates the at least one unit (12) to perform a program cycle, corresponding to the voice command (22) of the user (24) that is captured by the voice input apparatus (20) and evaluated by the voice recognition device (28), on the basis of whether the action detection apparatus (18) has detected operation (19) of the operating component (16) by the user (24).
