Abstract (en)  
A system for arresting movement of a heat exchanger core includes a main housing, an internal housing and a pressing arrangement. The internal housing is located in the main housing and receives the heat exchanger core. The internal housing includes a first portion and a second portion. The second portion is displaceable with respect to the first portion. The pressing arrangement is configured between the second portion and the main housing. The pressing arrangement presses the second portion against the heat exchanger core, when at least a predetermined portion of the internal housing is received in the main housing.
