Abstract (en)  
[origin: WO2020125863A1] The invention relates to a new payment means (1), preferably in the form of a coin or a banknote or a credit card, in which an RFID chip (6) is integrated, so that the nominal value of the payment means (1) can be read electronically in a contactless manner, and also a valuable object, preferably a diamond (4), which represents the value of the payment means (1). Neither the diamond (4) nor the RFID chip (6) can be removed non-destructively from the payment means (1), and the value and also the properties of the diamond (4) or valuable object are furthermore documented in the block chain in encrypted form as well as the current digital proprietor. On the basis of this documentation a digital payment means, namely a so-called unique, i.e. irreplaceable, cryptographic token, can be generated, which can be freely traded via a secured digital trading platform, i.e. it can be sold, purchased or returned to the issuer of the payment means (1) upon payment of the monetary value.
