Abstract (en)
[origin: WO2019038419A1] The invention relates to a chair comprising a supporting frame (2), a supporting unit (4), which is arranged on the supporting frame (2), a seat element (6) and a backrest element (8), which are each supported by the supporting unit (4). The chair also comprises a first release element, which is arranged between the supporting unit (4) and the seat element (6) and on which at least one Bowden cable (34, 35, 36, 37) of at least one functional element acts, which release element is adjustable between a rest position, in which the release element does not act on the at least one Bowden cable (34, 35, 37, 37), and an activation position, in which the release element acts on the at least one Bowden cable (34, 35, 36, 37) and thus activates the functional element. The release element is preloaded into the rest position thereof by means of a release element loading means, wherein the first release element is formed in such a way that the displacement from the rest position of the first release element into the activation position thereof is carried out by means of the weight of an object acting on the first release element.
