Abstract (en)

[origin: WO2020108708A1] The invention relates to a device for securing to a component, having a compensating element (1) and a main element (2), the compensating element (1) being connected to the main element (2) by a threaded connection, characterised in that an engagement region (4) for an operating tool is arranged on and/or in the compensating element (1) in order to rotate the compensating element (1) relative to the main element (2).
