Abstract (en)

[origin: WO2019048792A1] The invention relates to a method for making a colour screen for a motor vehicle lighting and/or signalling device. The method according to the invention comprises a step of compressing a first film (2) against a second film (10) having a greater surface area, such that the first film (2) perforates the second film (10) and thus makes a space (22) having the dimensions of the first film (2). The first and second films are made of plastic material and are of different colours. Subsequently, a step of positioning the first film (2) in the space (22) is carried out such that said space (22) is plugged and a colour screen (24A) made of plastic material according to the invention is formed.
