Abstract (en)  
[origin: CN111411428A] The invention discloses a drawing device (1) of a spinning machine. The device comprises a roller pair (2, 3, 4) and an oscillating device (6), wherein at least one composite fiber material (5) can be stretched in the middle of the roller pair; the oscillating device also comprises an oscillating element (7), which can oscillate in its axial direction (X) relative to the roller pair, and at least one thread guide (8), which oscillates the at least one composite fibrous material by oscillation of the thread guide; the stretching device further comprises a pressing device (9) and at least one support (23, 24). In the invention, the oscillating element is arranged on the at least one support in such a way that the at least one thread guide is moved in the axial direction (X) relative to the oscillating element by an oscillating movement on the at least one support in such a way that the at least one thread guide (8) is aligned in the axial direction (X) relative to the pressing device (9).
