Abstract (en)

In an assembly of a waling beam for retaining a retaining wall and a coupling piece for coupling the waling beam to another body, at least one outer side of the waling beam is provided with a plurality of coupling elements which are located at a distance from each other in longitudinal direction of the waling beam. The coupling piece is provided with a coupling member which is connectable to each of the coupling elements. The coupling member and each of the coupling elements form a cooperating projection and cavity which fit to each other such that the coupling piece is lockable with respect to the waling beam in at least one of the longitudinal direction and transverse direction of the waling beam. In the non-assembled condition the projection forms a fixed part of one of the waling beam and the coupling piece.
