Abstract (en)  
[origin: EP3681260A1] A component mounting machine used for effectively avoiding interference between a head main body and a station during exchange of a component holding tool attached to the head main body, the component mounting machine including: a head main body attached to a component mounting machine main body to be capable of being raised and lowered, and configured to detachably hold a component holding member configured to hold a component; a head moving mechanism configured to move the head main body with respect to the component mounting machine main body in a raising and lowering direction; a station attached to the component mounting machine main body to be capable of being raised and lowered, and configured to hold an exchange-use component holding member; a station moving mechanism configured to move the station with respect to the component mounting machine main body in the raising and lowering direction; and a control device configured to use the station moving mechanism to change a height position in the raising and lowering direction of the station during exchange of the component holding member to be attached to the head main body in accordance with a height position in the raising and lowering direction of the head main body.
