Abstract (en)

[origin: WO2019047494A1] A combination lock (10) has a touch panel (70) to receive a keypad entry code (30-39) indicative of a combination code for unlocking the lock with various access levels, including a first level and a second level. The combination lock (10) is also arranged to receive the combination code from a mobile device (700) via wireless signals. The combination lock (10) also has an independent key-lock mechanism for unlocking the lock with a key. The mobile device (700) has an application icon, when activated, prompting the wireless signals indicative of the combination code. The mobile device (700) also has a deactivation icon and a re-activation icon associated with the combination code of the first level. The deactivation icon causes the disablement of the touch panel (70) and the key-lock mechanism when activated. The re-activation icon terminates the disablement of the touch panel (70) and the key-lock mechanism when activated.
