Abstract (en)

[origin: EP3683958A1] Provided is a control device for a synchronous electric motor for performing a PWM drive control without performing current feedback, which has a configuration capable of stably driving the synchronous electric motor in any rotation speed region. The control device 1 includes a torque clamp generator 40 configured to set a torque clamp value, a command generator 10 configured to generate a voltage command based on a rotation speed command and the torque clamp value without feeding back a current flowing through the synchronous electric motor 2, a PWM signal generator 20, and an inverter part 30. The torque clamp generator 40 sets a start time limit value as the torque clamp value in a startup region of the rotation speed of the synchronous electric motor 2, and sets a normal time limit value as the torque clamp value in a region other than the startup region of the rotation speed of the synchronous electric motor 2. The start time limit value is larger than the normal time limit value and larger than the torque clamp value capable of continuously rotating the synchronous electric motor 2 at the rotation speed in the startup region.
