Abstract (en)
A negative impedance circuit comprises:- a differential circuit stage (10) having a first input, a second input and an output,- a positive feedback path (A) from the output to the first input of the differential circuit stage (10),- a negative feedback path (B) from the output to the second input of the differential circuit stage (10).The negative feedback path (B) comprises a unitary gain path from the output to the second input of the differential circuit stage (10), the unitary gain path being coupled to ground (GND) via a reference impedance (Z_{REF}).The negative feedback path (B) and the positive feedback path (A) comprise a first transistor (M1) and a second transistor (M2) having respective control electrodes driven by the output of the differential circuit stage (10) with the first transistor (M1) and the second transistor (M2) coupled in a current mirror arrangement, wherein a negative impedance (Z_{NEG}) is available at the first input of the differential circuit stage (10).
