Abstract (en)
[origin: WO2019057398A1] The invention relates to a luminaire (1) having a first housing part (10) and a second housing part (20), which can be rotated relative to each other about a rotational axis (A), and a stop (2), which is designed to limit the rotational movement of the housing parts (10, 20) relative to each other in both opposite rotational directions (D1, D2) of the housing parts (10, 20) about the rotational axis (A). The stop (2) has a first stop part (11) which is connected to the first housing part (10) and a second stop part (21) which is connected to the second housing part (20), wherein the stop parts (11, 21) are designed to interact in order to limit the rotational movement in each rotational direction (D1, D2), and at least one of the stop parts (11) is designed to be flexible such that the flexible stop part (11) is deformed when the two stop parts (11, 21) interact as a result of the rotation of the housing parts (10, 20) relative to each other.
