Abstract (en)

[origin: WO2019057887A1] Method for simulating respiratory dynamics of a virtual lung on the basis of a virtual lung model (MODp) configured as a function of a first parameterization (PARA1) and at least one ventilation mode (MODv), comprising:
■ a first configuration (CONFp) of the virtual lung model (MODp);
■ a second configuration (CONFr) of a model of a virtual respiratory system (MODr) comprising a functional relationship between:
o on the one hand an air flow rate (Q) inhaled or exhaled by a virtual patient and;
o on the other hand at least one considered pressure (P) in the respiratory circuit, o said considered pressure (P) being a resultant pressure (Prest) at which is subtracted an internal pressure (Pi) comprising a muscular pressure (Pmus) and the pressure inside the lung (PP);
■ a third configuration (CONFv) of at least one ventilation mode (MODv), the method comprising generation of at least one curve (TRACE(Vpf(Pp))).
