Abstract (en)  
[origin: WO2019121048A1] The invention relates to a winding assembly for a transformer, in particular with a medium operating voltage of  $U_m \geq 72.5$  kV, wherein the winding assembly has at least one winding (1), which ends in a winding conductor (3), wherein the winding conductor (3) is connected to a switching line (2), which is designed to interconnect the winding (1) to other windings. To reduce the danger of partial discharges and flashovers in the high-voltage end-line region for high-temperature applications, it is provided that the connection of the switching line (2) to the winding conductor (3) is arranged inside the winding (1).
