Abstract (en)  
[origin: WO2019063932A1] The invention concerns a technique for remote administering of a device (20,21) by an administration server (31). A management operation is to be executed by the administration server on the device. A piece of information on state of use of the device is then obtained and an execution impact of the management operation is evaluated for a quality of service for a service supplied by the device, depending on the piece of information obtained and the management operation to be executed. A postponement of the execution of the management operation is requested from the administration server. This postponement is determined according to the piece of information obtained, that impact and a policy for executing management operation defining an association between a state of use of a device, an operation and an impact.
