Abstract (en)  
[origin: WO2019129519A1] A device together with an associated working machine for decoupling vibrations between two systems (2, 4) in the form of spring-mass vibrators, of which one system (2) is assigned to a movement machine, and the other system (4) is assigned to an operator acting on the movement machine, which system at least partially in the case of travelling movements of the movement machine executes movements about a transverse axis (Q) and in the process subjects vertical movements in the direction of a vertical axis (z) to an absolute vertical speed (vz1,1) which serves as an input variable of open-loop and/or closed-loop control devices which, in order to compensate the vibrations, actuate a damping system (8) of the one system (2) and/or other system (4), characterized in that the respective pitching movement of the other system (4) is sensed by means of at least one rotational speed sensor, the respective measured value ( $\omega_1$ ) of which preferably yields the absolute vertical speed (vz1,1) as an input variable only when amplified by a predefinable factor (L1).
