Abstract (en)

[origin: WO2019072654A1] The invention relates to a door having a door body that can be lifted, along a predetermined path, from a closed position in which it closes a wall opening into an open position in which said door is located substantially overhead, the door body having two, three or more door body elements arranged one on top of the other in the closed position. According to the invention, an edge of the door body that is lowermost in the closed position and trails during lifting can, when the door reaches the open position, be lifted separately with respect to a door body element arranged thereabove in the closed position and with respect to the predetermined path, by pivoting the lower door body element that has said edge.
