Abstract (en)

[origin: WO2019077192A1] A method of operating a fire protection water distribution (FPWD) system is provided. The method includes logging an initial value of a condition of the FPWD system, running an FPWD system component to drive a pumping of fluid through the FPWD system until a predefined end value of the condition is reached, determining a length of time the FPWD system component is run, logging a new value of the condition following a predefined wait time and calculating an amount of air in the FPWD system based on at least the initial and new values of the condition and the determined length of time.
