Abstract (en)

[origin: WO2019048735A1] According to an aspect, there is provided a solution for operating a door lock with an electronic locking device. The electronic locking device (100A - 100E) comprises an operating power interface (106), a processing unit (102) and a vibration sensor (104) coupled between the operating power interface and the processing unit and configured to wake up the processing unit from an idle state to a normal operation state in response to detecting vibration induced to the electronic locking device.
