Abstract (en)

[origin: EP3699397A1] A waterproof covering system (1) for covering a surface comprising a geotextile (2), a geogrid (8) arranged on the geotextile (2). The system further comprises anchoring means (10), comprising a nailing member (12) and a retaining plate (14) operatively associated thereto. The retaining plate (14) comprises a plurality of through holes and is arranged such that in the operation position of the anchoring means (10), the retaining plate (14) overlaps the geogrid (8). Finally, a first coating layer (18) of synthetic polymer forms a continuous coating is applied by in situ projection. The first coating layer (18) covers the geotextile (2), the geogrid (8) and the anchoring means (10), and cures to a solid state to provide a positive fit connection between the first coating layer (18) and the anchoring means (10). The invention further relates to a civil structure and a method for forming a waterproof covering system.
