Abstract (en)
[origin: WO2019081722A1] The invention relates to a system (100) for supporting a movement of a person (101) with an object (102). The system (100) comprises a detection device (103) for detecting an actual state of the object (102). Furthermore, the system comprises a sensor arrangement (104) which is designed to detect at least one physiological parameter of the person (101). The system (100) further has a determination device (105) for determining a target state of the object (102) as a function of the detected physiological parameter. The system (100) further comprises a display device (106) for displaying an indication when the actual state differs from the target state. The invention further relates to a method and to a computer program product.
