Abstract (en)

[origin: EP3482684A1] The present disclosure relates to a medical apparatus (126) comprising a display (132), a processor (130), and a memory (136) storing machine executable instructions (160-168). Execution of the instructions (160-168) causes the processor (130) to control the medical apparatus (126) to obtain a graphical representation (144) of magnetic resonance data (142) of an anatomical structure of interest (109). The graphical representation (144) is displayed on the display (132). Furthermore, a local blood oxygenation signal from a catheter (107) is received as well as a position tracking signal of the catheter (107) tracking positions (148) of the measurements of local blood oxygen saturation levels. Using the measured local blood oxygen saturation levels and the tracked positions (148) of the measurements, a spatial distribution (146, 402-408, 512-518, 612-618) of local blood oxygen saturation levels is displayed within the graphical representation (144).
