Abstract (en)

[origin: WO2019092644A1] The invention relates to a method and a device for needle-free injecting of fluid into a substrate, in particular injecting a fluid pharmaceutical or cosmetic preparation into a biological tissue, whereby, in a particularly advantageous manner, it is possible to reliably inject an in particular fine fluid jet into the substrate, without bringing about a considerable increase in the static pressure in the fluid during the injection process. According to the invention, this is achieved in that the fluid accommodated in a fluid container (24) is initially accelerated to a starting speed together with said container, before the fluid container is stopped from moving, while, simultaneously, the fluid (25) is ejected from the fluid container (24) through an outlet nozzle (33) while at least partially maintaining its movement. Preferably, the ejected fluid jet is caused to rotate about its jet axis before coming into contact with the substrate, such that the jet has a helical movement and thereby practically bores into the substrate, without spraying out laterally.
