Abstract (en)

[origin: WO2019182522A1] Internally illuminated door, window and/or cabinet accessory, and method of making the same provide for solution to technical problem of availability of door sills and door or window handles with illumination means such as LED or other type of light which is directly visible to the user and presents intrusion rather than forming part of background lighting by using internal light source such as LED or the like, by providing openings in handle housing, and by allowing light emitted by internal illuminating means to be seen through said openings. By choosing suitable material such as translucent adhesive or mixture of said adhesives or mixture of at least one adhesive and small particles such as quartz dust to diffuse said light thereby providing for diffuse light or soft glow. Further, openings can be cut in form of a name such as family name hence adding personal touch to each handle.
