Abstract (en)
[origin: WO2019122767A1] The invention relates to a ventilation device (2) intended to generate a flow of air (F1) towards a motor vehicle heat exchanger (1), the ventilation device (2) comprising: - a plurality of ducts (8), - at least one air manifold (12) comprising orifices, each duct (8) opening via one of its ends into a distinct orifice of the air manifold (12), each duct (8) having at least one passage opening (40; 16) for a flow of air (F2) passing along the said duct (8), the opening (40; 16) being distinct from the ends of the corresponding duct (8), the opening (40; 16) being situated on the outside of the at least one air manifold (12), at least two ducts (81, 82; 8a, 8b, 8c) being arranged in such a way that their openings (40; 16) are oriented towards the heat exchanger (1) at different angles.
