Abstract (en)  
[origin: WO2019086173A1] The invention relates to an arrangement (100) for determining body surface properties. The arrangement comprises: a capture unit (110) for capturing body surface features; an evaluation unit (120) for evaluating the captured body surface features and for determining the body surface properties on the basis of the captured body surface features; and a user interface (130) having an output unit (134), the user interface being designed to interact with a user. The evaluation unit (120) is designed to query a data storage unit (140) using the determined body surface properties, to receive from the data storage unit (140) features of treatment agents and/or instructions for use for the non-therapeutic treatment of a body surface according to the determined body surface properties and to instruct the output unit (134) to output information relating to the treatment agents and/or instructions for use to a user. The evaluation unit (120) is a portable computing unit and the detection unit is designed to detect the body surface features by means of multiple spatially resolved reflection spectroscopy (MSRRS) in a wavelength range between 300 nm and 1500 nm.
