Abstract (en)

[origin: WO2019097053A1] The present invention relates to a device for compartmentalizing liquids. More particularly, the present invention relates to an overspill-protection compartmentalizing device (1) to be used in conjunction with a liquid container. The container may be a glass, a beaker, a cup or any other device for containing a liquid of any kind. According to the invention, the compartmentalizing device (1) uncoils so as to take up the width of the container in order to divide the liquid present inside the container and to avoid spillages and splashing in the event of shaking caused by a person or an environment. It notably allows persons suffering from tremors to avoid being stigmatized by having a discreet device.
