Abstract (en)
[origin: WO2019097324A1] The invention relates to a device (4) for compensating for a change in length of a bar (3), in particular a bus bar, held on a supporting body (22) in a direction of the change in length (6), said device comprising: a first body part (24) having a supporting body interface (26) for connection to the supporting body (22); - a second body part (27) with a bar interface (29) for connection to the bar (3); and - a guide, by means of which the first body part (24) and the second body part (27) are mounted in a manner guided movably relative to one another in a guide direction with a direction component in the direction of the change in length (6).
