Abstract (en)

[origin: US2020268045A1] The present invention relates in particular to a foldable container (1) for loose tobacco, which is delimited by two longitudinal walls (10, 11) which have a common longitudinal edge (101), and by two opposite transverse walls (12, 13) shaped like bellows, characterized by the fact that said transverse walls (12, 13) shaped like bellows consist of five successive pleats (P1, P2, P3, P4, P5), and that the two adjoining transverse wall elements (122, 123) which constitute at least one (P4) of said pleats are configured to occupy either a first position in which they form a re-entrant corner, or a second position in which they form an outer corner and thus constitute a pouring spout.
