Abstract (en)  
Disclosed is a smoking substitute system comprising a device having a first housing portion and a second housing portion configured for snap engagement with the first housing portion when moved towards one another along an engagement axis. The second housing portion comprises an elongate engagement member having a hook portion at a distal end thereof, the elongate member configured to flex from an engaged position in which the hook portion engages the first housing portion to a disengaged position in which the hook portion is deflected away from the engagement axis. The device further comprises a reinforcement element mountable to the second housing portion and configured to resist flexing of the elongate member away from the engagement axis.
