Abstract (en)  
[origin: EP3712494A1] The present invention relates to a module (10) for making a structure, such as for example a frame, a support structure, a secondary frame, a lamp, and the like, characterised in that it provides a pre-cut body (1) comprising a plurality of flaps (7) which are substantially equal to one another, each flap (7) being connected to the adjacent flaps (7) by means of fold lines (2), each flap (7) providing coupling means (4, 5, 8, 9, 9') which are complementary with corresponding coupling means ( ) of a further module (10) and at least one fold line (3), the combination of said fold lines (2; 3) making it possible for said module (10) to pass from a substantially flat resting configuration to an upright configuration by the coupling with one or more further modules (10).The invention also relates to a structure made with said modules (10).
