Abstract (en)
[origin: WO2019101283A1] According to the invention, items are clamped between damping covers (11, 51) which are each secured around a support (12, 52), wherein a plurality of composite bodies (5, 10) are oriented with respect to one another such that their supports (12, 52) are arranged in parallel and are held, with their end protruding from the cover (11, 51), in holes (21) of a plate (2), in particular locked onto the plate with form-fit or force-fit engagement. Preferably, plates (2) can be locked onto one another with form-fit engagement to form a plate layer (20), or the composite bodies (5, 10) are components connected to one another by cohesive bonding. By means of injection moulding, plates (2) and supports (12, 52) of composite bodies (5, 10) are shaped such that the supports (12, 52) fit with one end into the plates (2) and with this end can be locked onto the plates with form-fit or force-fit engagement. Preferably, connection webs (3, 4) and plates (2) are shaped such that the plates (2) can be locked onto the connection webs (3, 4) to form a plate layer (20).
