Abstract (en)

[origin: WO2019097075A1] The invention relates to a surgical clip of branch-crossed design with two Z-shaped clip branches, which are connected to each other at a proximal end of each of the clip branches by means of a spring-elastic connection piece (6), wherein at a distal section (8a, 8b) each of the clip branches has a jaw part with a gripping surface, wherein in an assembled position of the clip, the clip branches cross and the gripping surfaces are opposite each other and are held in contact on one another by means of a closing force of the spring-elastic connection piece, characterised in that at least one first clip branch has a groove (24b) in which the second clip branch is held and/or guided, at least in sections, such that a displacement of the clip branches in a transverse direction of the clip branches is prevented.
