Abstract (en)

[origin: WO2019101449A1] The invention relates to a device for manually or mechanically producing a hose-like packing material from a paper web that has been wound up into a roll which forms an internal cavity from which the paper web can be drawn to form the packing material, comprising a receptacle for at least partially circumferentially gripping the roll and an axial holder for holding one end face of the roll, wherein the axial holder has a wall in which a discharge opening is formed for discharging the packing material in an axial discharge direction, wherein the wall has a guiding inner contour tapering in the form of a funnel from the receptacle to the discharge opening in the axial discharge direction, and wherein the wall is provided with at least one front axial recess in a front end of the axial holder as considered in the discharge axial direction, which recess extends at least 10 mm in the axial discharge direction, starting at the front end of the axial holder.
