Abstract (en)

A servo valve (10) comprises a valve housing (12), a cavity (16) formed in the valve housing (12) defining an axis (X) and an axially moveable member (18) disposed in the cavity (16). The member (18) comprises flat surfaces (64a, 64b) parallel to the axis (X). A channel (20) is formed within the cavity (16) and a plurality of ports (48a, 48b, 48c) each forming a fluid passage through the valve housing (12) in fluid communication with a spool (80) and with the channel (20). The plurality of ports (48a, 48b, 48c) comprise first and second nozzles (50a, 50c) with nozzle openings (52a, 52c), wherein in a first axial position of the member (18) the first nozzle opening (52a) is at least substantially obstructed by the first flat surface (64a), and in a second axial position of the member (18) the second nozzle opening (52c) is at least substantially obstructed by the second surface (64b), the member (18) controlling fluid between the spool (80) and the channel (20).
