Abstract (en)

[origin: WO2019117709A1] An assembly (1) of a container (2) with an opening (4) and a closure cap (3) by means of which the opening can be closed, wherein said closure cap comprises: • - a rigid element (5) at the upper surface of the cap, which, on one side, can be tilted about a pivot (6) which is located in the upper surface or which extends parallel to said upper surface, and said rigid element is connected, on the other side, with a flexible member (7) which causes the rigid element to tilt when pressure is exerted thereon, and • - an initially closed space (8), located below the upper surface, which is bounded at the end faces by at least the tiltable, rigid element to which an opening member (9) projecting into said space is secured, and by a seal (10) which, when the rigid element is tilted, is cut and opened by the opening member.
