Abstract (en)

[origin: WO2019114919A1] The invention relates to a method for operating a control system for controlling a lighting installation, wherein the control system comprises at least two light-adjusting modules, wherein each light-adjusting module comprises at least one digital processor and at least one digital memory for producing, managing and storing lighting programs, and wherein each light-adjusting module comprises a housing, in which the digital processor and the digital memory are arranged, and wherein, in each light-adjusting module, digital setting commands are generated, which can be transmitted to the lighting devices of the lighting installation via data links, and wherein the various light-adjusting modules can exchange transfer data with one another via data lines and data interfaces, wherein a) a system time signal is generated in one light-adjusting module, b) the system time signal is passed on via the data lines to all the light-adjusting modules of the control system, c) the lighting programs in the various light-adjusting modules are processed by using the system time signal.
