Abstract (en)

[origin: WO2019122788A1] The microfluidic chip (1) comprises:
• at least one inlet channel (4) connected to at least one well (2), each well (2) being associated with an outlet channel (5);
• at least one analysis chamber (3a, 3b) connected to at least one well (2);
• an analysis surface (6) comprising collection elements (6a) collecting biomarkers present in the liquid originating from the well (2) and representative of the cellular response of a biological sample contained in the well (2). A flow of liquid flows from the well (2) towards the analyse surface (6) comprising the collection elements (6a). The flow of liquid flows at between 0.1µL/min. and 2 ml/min. and flows in a laminar manner through the analysis chamber (3a, 3b). The chip (1) is part of a microfluidic lab-on-a-chip provided with a flow generator applying a plurality of different liquids.
