Abstract (en)

[origin: WO2019121801A1] The invention relates to a method for matching an actual position of a shutter of a motorized closing device and a commanded position of said shutter, the commanded position being associated with a value of a control parameter of the motorized closing device, the method being executed by an electronic device comprising: a digital camera for capturing an image or video, a screen for displaying a graphical interface, an input device allowing a user to interact with the displayed graphical interface, the method being based on a superimposed display on the graphical interface of markers corresponding to predetermined positions of the shutter and of an image or of a video of the motorized closing device captured by the digital camera, the superimposition of the markers on a position of the shutter displayed in superimposed form making it possible to determine a setting of a matching function.
