Abstract (en)

[origin: WO2019120874A1] The invention relates to a cooking device (1) comprising a catalyst device (12) that has a base unit (15), which is made of an electrically conductive material and on which a plurality of catalytically active elements (16) or a catalytically active surface coating of the catalyst device (12) is arranged, and comprising an electric energy unit (13), by means of which the base unit (15) can be supplied with electric energy for a self-heating process of the catalyst device (12). The base unit (15) has electric connection regions (17, 18) for connecting the electric energy unit (13), and the electric connection regions (17, 18) are at least partly made of a pressed material region of the base unit (15) and/or at least partly have an electrically conductive adhesive (19). The invention also relates to a method.
