Abstract (en)
[origin: WO2019130007A1] The invention relates to a microwave component (102) comprising a propagation zone running along a propagation axis (X-X) and being bounded transversely, with respect to the propagation axis (X-X), by at least one electrically conductive wall (23, 26), the propagation zone (5) being configured to exhibit, at a predetermined reference temperature, a corresponding predetermined frequency response, the microwave component (102) being characterized in that it further includes at least one compensation block (28) arranged in the propagation zone (5), the at least one compensation block (28) being made of a dielectric material having a dielectric permittivity whose derivative with respect to temperature is of the opposite sign to at least one thermal expansion coefficient of the propagation zone (5) so as to compensate for a variation in the frequency response with temperature.
