Abstract (en)

The invention relates to a mannequin (1) for supporting a pair of trousers whereon a laser marking is performed, comprising two leg structures (2) to be housed on the inside of the trouser legs. Each structure is defined by a respective imaginary longitudinal axis (20) wherein the respective trouser leg extends, an upper area (21), a lower area (22), a front plane (23), a rear plane (24), an inner side (25) and an outer side (26) whereon the outer edge is arranged, which goes from the waist to the lower end of the trouser leg. The separation distance between the inner side and the outer side is variable by means of a respective tensing mechanism (3), each structure being able to adopt and go from a non-operative loosened position (A) to a maximum tensed end position (B) in order to perform the marking. The leg structures (2) are coupled in an articulated manner to a main rotation axis (5) around which they are able to rotate, parallel to the direction of the dimension of the rise of the pair of trousers or collinear with said direction, the front planes (23) of the two leg structures (2) being able to form between each other at least two angles greater and/or less than 180°.
